-!- FUNCTION: IMP IS THE RATE LIMITING ENZYME IN THE DE NOVO SYNTHESIS OF GUANIUE NUCLEOTIDES AND THEREFORE IS INVOLVED IN THE REGULATION OF CELL GROWTH (BY SIMILARITY).

-!- CATALYTIC ACTIVITY: INOSINE 5'-PHOSPHATE + NAD(+) + H(2)O = XANTHOSINE 5'-PHOSPHATE + NADH.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            DEGENERAL FACA N.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 6, Application US/08826611
Patent No. 6031154
CENERAL INFORMATION:
APPLICANT: Bennett, Alan B.
APPLICANT: Ranayama, Yoshinori
TITLE OF INVENTION: Fructokinase Genes and Their Use in
TITLE OF INVENTION: Metabolic Engineering of Fruit Sweetness
NUMBER OF SEQUENCES: 6
CORRESPONDENCES DE CORRESPONDENCE ADDRESSE: Townsend and Townsend and Crew LLP
STREET: Two Embarcadero Center, Eighth Floor
                                                                                                                                                                                                                                         APPLICANT: Donadio, S
APPLICANT: About Laboration:
APPLICANT: Acalpine, J B
TITLE OF INVENTION: Method of Directing Biosynthesis of
TITLE OF INVENTION: Specific Polyketides
NUMBER OF SEQUENCES: 27
CORRESPONDENCE ADDRESS:

                                                                                                                  comprising of a tumour homing molecule that selectively homes to a mammaalian cell type or tissue, linked to an antimicrobial peptide. The homing pro-apoptotic conjugates are selectively internalised by the mammaalian cell type or tissue and exhibits high toxicity, especially to angiogenic vasculature. The antimicrobial peptide has low mammalian cell toxicity when not linked to the tumor homing molecule. In addition, the antimicrobial peptide has an amphipathic alpha-helical structure. The conjugates are useful for the treatment of cancer e.g. Kaposi's sarcomabreast and prostate cancer or melanoma. The present sequence is one such prostate homing pro-apoptotic conjugate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Chimeric prostate-homing pro-apoptotic peptide; prostate-homing peptide; antimicrobial peptide; prostate cancer; breast tumour homing molecule;
            Homing pro-apoptotic conjugate comprising a tumor homing molecule that selectively homes to a mammalian cell type or tissue linked to an antimicrobial peptide, useful for the treatment of prostate cancer -
                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel chimeric prostate-homing pro-apoptotic peptide, used to treat prostate cancer, comprises a prostate-homing peptide linked to an antimicrobial peptide -
                                                                                                    The present invention relates to homing pro-apoptotic conjugates

The DNA sequence encoding this sequence (together with 4 others, see AAR07413 and AAR08165-67) contains the Neo structural gene or its deriv. with, except for the region upstream of the translation initiation codon, and the translation initiation codon itself, 7 additional ATG sequences present. A plasmid contg. this sequence can also comprise a promoter. The combination of plasmids having different expression powers, results in various kinds of regulatory sequences having different expression capacities which can be measured quantitatively. See tag b of AAQ06275.
                                          The patent discloses novel chimeric prostate-homing pro-apoptotic peptide which comprises a prostate-homing peptide linked to an antimicrobial peptide, where the chimeric peptide is selectively internalised by and exhibits high toxicity to prostate tissue and where the antimicrobial peptide has low mammalian cell toxicity when not linked to prostate-homing peptide. The chimeric peptide is used to direct an antimicrobial peptide in vivo to a prostate cancer, to induce selective toxicity in vivo in a prostate cancer, and to treat a patient with prostate cancer. The present sequence is a chimeric
                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This is a modified Th5 (transposon 5) transposase enzyme sequence that has both greater avidity for Th5 outside end (OE) repeats and is less likely to assume an inactive multimeric form than a wild type Th5 transposase. This can be used in the construction of novel genetic constructs which comprise this Th5 transposase encoding nucleotide sequence and a transposable DNA sequence flanked at its 5' and 3' ends by an 18 or 19 base pair flanking DNA sequence comprising nucleotide A at position 10, T at 11 and A at 12. The modified Th5 transposase and the transposable DNA which is a DNA donor molecule are used in a system for in vitro transposition. The system and method can be used to create absolute defective mutants, to provide selective markers to target DNA, to forcible regions of homology to a target DNA, to facilitate insertion of specialised DNA sequences into target DNA, to provide primer binding sites or tags for DNA sequencing, to facilitate production of genetic fusion for gene expression studies and protein domain mapping, as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 well as to bring together other desired combinations of DNA sequences (combinatorial genetics). The modified Tn5 transposase facilitates in vitro transposition reaction rates of at least about 100-fold higher
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Modified Tn5 transposase construct used in novel system for in vitro transposition - used to, e.g. create absolute defective mutants, provide selective markers and to facilitate insertion of specialised DNA sequences into target DNA
                                                                                                                                                                                                                                                                                           Tn5 transposase; modified; enzyme; in vitro transposition; mutant; target; marker; transposon 5.
                                                                                                                                                                                                                                                                                                                                                                                                                              /label- E54K

```
This sequence represents mutant Tn5 transposase EK54 MA56 LP372. This mutant form differs from the wildtype in that it binds to repeat sequences of donor DNA with greater avoidity than the wildtype Tn5 transposase and it is less likely than the wildtype protein to assume an inactive multimeric structure. The improved avidity of the modified transposase for the regeat sequences for the outside End (DE) terminic is due to the Lys residue at amino acid 54, which is Glu in wild type Tn5 transposase (AAV42536). The mutation strongly alters the preference of the transposase (AAV42536). The mutation strongly alters the preference to the higher binding of this mutation, known as EK54, to DE termini. The higher binding of this mutation, known as EK54, to DE termini. The higher binding of this mutation, known as EK54, to DE termini results in a transposase. Similar changes at position 54 to val and position 47 (Thr to Pro change) also result in increased binding to the DE termini. The reduction in the formation of the inactive mutimeric form is achieved by modifying amino acid 372 (Leu) of wildtype Th5 transposase to Pro (LP372). This sequence also has a substitution of translation of an inhibitor protein, the initiation codon of which
                                                                                                                                                                                                                                                                                                                                                                                                                          ö
than can be achieved using wild type transposase (as measure in vivo). In vitro transposition using this system can also use donor DNA and target DNA that is circular or linear. The system also requires no outside high energy source and no other protein other than the modified
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Modified transposase enzyme for use in a system for introducing genetic changes to nucleic acid \dot{}

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This sequence represents the wildtype Tn5 transposase. Various mutant forms of this enzyme were found to bind to the repeat sequences of donor by with greater avidity than the wildtype. Mutants containing a substitution of Pro for Leu at position 322 (AAN42535, AAN42537, AAN5537, AAN5537,
                                                                                                                                    transposase enzyme is useful in a system for introducing genetic changes to nucleic acid. The method can be applied to create absolute defective mutants, to provide selective markers to target DNA, to provide portable regions of homology to a target DNA, to facilitate insertion of specialised DNA sequences into target DNA, to provide primer binding sites or tags for DNA sequencing, and to facilitate production of genetic fusions for gene expression studies and protein domain mapping.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Modified transposase enzyme for use in a system for introducing genetic
                           mutant transposase exhibits a somewhat higher transposition rate. The Tn5-based transposition system is more broadly applicable and utilises shorter, more well defined termini that are active on DNA of any structure when compared to Mu- and Tn10-based systems. The mutant
corresponds to the sequence encoding wildtype Met 56. As a result, the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Transposase; modified form; wildtype; mutant; multimeric; OE termini; IE termini; outside end termini; inside end termini; repeat sequence; mutation; mutein.

char42538, AAY42540) and position 47 (Thr to Pro change, TP47, AAY42542))

also result in increased binding to the OE termini. Mutants with a also result in increased binding to the OE termini. Mutants with a substitution of Ala for wildtype Met at position 5 exhibited a higher transposition rate than the wildtype. This substitution prevents the transposition of an inhibitor protein, the initiation codon of which corresponds to the sequence encoding wildtype Met 56. The Th5-based transposition system is more broadly applicable and utilises shorter, more well defined termini that are active on DNA of any structure when compared to Mu- and Th10-based systems. The mutant transposase enzyme is useful in a system for introducing genetic changes to nucleic acid. The method can be applied to create absolute defective mutants, to provide selective markers to rarget DNA, to provide primer binding sites or tags for DNA sequences into target DNA, to provide primer binding sites or tags for DNA sequences can to target DNA, to provide primer binding sites or tags for DNA sequences into target DNA, to provide primer binding sites or tags for DNA sequences can be present sequence is not shown in the specification but is derived from the mutant Tn5 transposase sequence given in columns 15-18.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This sequence represents mutant Tn5 transposase EK54 LP372. This mutant form differs from the wildtype in that it binds to repeat sequences of donor DNA with greater avidity than the wildtype Tn5 transposase and it is less likely than the wildtype protein to assume an inactive multimeric structure. The improved avidity of the modified transposase for the repeat sequences for the Outside End (OE) termini
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Modified transposase enzyme for use in a system for introducing genetic

is due to the Lys residue at amino acid 54, which is Glu in wild type Transposase (AAV42536). The mutation strongly alters the preference of the transposase (Control of the Inside End (IE) termini. The higher binding of this mutation, known as EK54, to OE termini. The higher binding of this mutation, known as EK54, to OE termini results in a transposaic. The reduction in the formation of the inactive multimeric form is achieved by modifying amino acid 372 (Leu) of wildtype Tn5 transposase to Pro (LP372). The Tn5-based transposation system is more broadly applicable and utilises shorter, more well defined termini that are active on DNA of any structure when compared to Mu- and Tn10-based systems. The modified transposase enzyme setul in a system for introducing genetic changes to nucleic acid. The method can be applied to create absolute defective mutants, to provide selective markers to target DNA, to provide portable regions of homology to a target DNA, to provide primer binding sites or tags for DNA sequencies and protein domain mapping.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents mutant In5 transposase EV54 LP372. This mutant form differs from the Wildtype in that it binds to repeat sequences of donor DNA with greater avidity than the wildtype In5 transposase and it is less likely than the wildtype protein to assume an
                                                                                                                                                                                                                                                                                                                                                      derived from the mutant Tn5 transposase sequence given in columns 15-18,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Modified transposase enzyme for use in a system for introducing genetic

Transposace for the repeat sequences for the Outside End (OE) terminicated transposace (AAY4236). The mutation strongly alters the preference of the transposace (AAY4236). The mutation strongly alters the preference of the transposace for the OE termini, as opposed to the Inside End (IE) termini results in a transposace for the sequence of the transposace for the a transposace. The reduction in the formation of the termini results in a transposace. The reduction in the formation of the inactive multimeric form is achieved by modifying amino acid 372 (Leu) of wildtype Transposace to Pro (LB72). The Tr5-based transposition system is more broadly applicable and utilises shorter, more well defined termini that are active on DNA of any structure when compared to Mu- and Tn10-based systems. The modified transposace enzyme is useful in a system for introducing genetic changes to nucleic acid. The method can be applied to create absolute defective mutants, to provide selective narkers to target DNA, to provide portable regions of homology to a target DNA, to provide primer binding sites or tags for DNA sequencing, and to facilitate production of specialised DNA sequencing, and to facilitate insertion of specialised DNA sequencing, and to facilitate domain mapping.

Note: The present sequence is not shown in the specification but is columns 15-18.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         enzyme for use in a system for introducing genetic

                                                                                                                                                                                                                                                                     ö
     transposase. The improved avidity of the modified
transposase for the repeat sequences for the Outside End (OE) termini
sis due to the Lys residue at amino acid 54, which is Glu in wild type
The transposase (AAY4236). The mutation strongly alters the preference
of the transposase for the OE termini, as opposed to the Inside End (IE)
termini. The higher binding of this mutation, known as ERS4, to OE
termini results in a transposition rate that is about 10-fold higher
system is more broadly applicable and utilises shorter, more well
defined termini that are active on DNA of any structure when compared to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence represents mutant Tn5 transposase EV54. This mutant form differs from the wildtype in that it binds to repeat sequences of donor DNA with greater aviality than the wildtype Tn5 transposase. The improved aviality of the modified transposase for the repeat sequences for the Outside End (OE) terminis due to the Val residue at amino acid 54, which is Glu in wild type Tn5 transposase (AAYA2536). The mutation strongly alters the preference of the transposase for the OE termini, as opposed to the Inside End (IE) termini. The higher binding of this mutation, known as EV54, to OE termini results in a transposition rate that is about 3-fold higher than
                                                                                                                                                           Note: The present sequence is not shown in the specification but is derived from the mutant Tn5 transposase sequence given in columns 15-18.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Modified transposase enzyme for use in a system for introducing genetic

                                                                                                            derived from the mutant Tn5 transposase sequence given in columns 15-18.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Note: The present sequence is not shown in the specification but is derived from the mutant Tn5 transposase sequence given in columns 15-18.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Modified transposase enzyme for use in a system for introducing genetic changes to nucleic acid \dot{\mathbf{c}}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents mutant Tn5 transposase LP372. This mutant form differs from the wildtype in that it is less likely than the wildtype protein to assume an inactive multimeric structure. The reduction in the formation of the inactive multimeric form is achieved by modifying amino acid 372 (Leu) of wildtype Tn5 transposase to Pro (LP372). The Tn5-based transposition system is more broadly applicable and utilises shorter, more well defined termini that are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Transposase, modified form, wildtype, mutant; multimeric; OE termini; IE termini; outside end termini; inside end termini; repeat sequence; mutation; mutein.

```
This sequence represents mutant Tn5 transposase MA56. This sequence has a substitution of Ala for wildtype Met at position 56. This substitution prevents the translation of an inhibitor protein, the initiation codon of which corresponds to the sequence encoding wildtype Met 56. As a result, the mutant transposase exhibits a somewhat higher transposition rate. The Tn5-based transposition system is more broadly applicable and utilises shorter, more well defined termini that are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Note: The present sequence is not shown in the specification but is derived from the mutant Tn5 transposase sequence given in columns 15-18.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Modified transposase enzyme for use in a system for introducing genetic changes to nucleic acid \dot{}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                active on DNA of any structure when compared to Mu- and Tn10-based

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents mutant Tn5 transposase TP47. This mutant form differs from the wildtype in that it binds to repeat sequences of donor DNA with greater avidity than the wildtype Tn5 transposase. The improved avidity of the modified transposase for the repeat sequences for the Outside End (OE) terminity of the modified transposase for the repeat sequences for the Outside End (OE) terminity of the transposase for the OE terminity as opposed to the Inside End (IE) terminity. The higher binding of this mutation, known as TP47, to OE terminity The higher binding of this mutation, known as TP47, to OE terminity and transposition rate that is about 10-fold higher than seen with wild-type transposase. The Tn5-based transposition defined terminity that are active on DNA of any structure when compared to when compared to the transposase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Note: The present sequence is not shown in the specification but is derived from the mutant In5 transposase sequence given in columns 15-18.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Modified transposase enzyme for use in a system for introducing genetic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents mutant Tn5 transposase EK54 MA56. This mutant form differs from the wildtype in that it binds to repeat sequences of donor DNA with greater avidity than the wildtype Tn5 transposase and it is less likely than the wildtype protein to assume an inactive multimeric structure. The improved avidity of the modified transposase for the repeat sequences for the Outside End (OE) termini; so due to the Lys residue at amino acid 54, which is Glu in wild type Tn5 transposase (AAY42536). The mutation strongly alters the preference of the transposase (or the OE termini, as opposed to the Inside End (IE) termini. The higher binding of this mutation, known as EK54, to OE termini. The higher binding of this mutation, known as EK54, to OE termini. The higher binding of this mutation, shown as EA54, to OE termini results in a transposition rate that is about 10-fold higher than seen with wild type transposase. This sequence also has a substitution of Ala for wildtype whet at position 56. This substitution prevents the translation of an inhibitor protein, the initiation codon of which corresponds to the sequence encoding wildtype Met 56. As a result, the mutant transposase exhibits a somewhat higher transposition rate. The Tn5-based transposition system is more broadly applicable and utilises shorter, more well defined termini that are active on DNA of any structure when compared to Mu- and Tn10-based systems. Note: The present sequence is not shown in the specification but is derived from the mutant Tn5 transposase sequence given in columns 15-18.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAY15382
```

```
This is the amino acid sequence containing the modified form of the transposase enzyme. This modified form differs from the wildtype in that it binds to the repeat sequences of the donor DAR with greater avidity than the wildtype TTS transposase and it is less likely than the wildtype TTS transposase and it is less likely than the wildtype protein to assume an inactive multimeric structure. The improved avidity of the modified transposase for the repeat sequences for the Outside End (OE) termini (class (1) mutation) can be achieved by providing a lysine residue at amino acid 54, which is achieved by providing a lysine residue at amino acid 54, which is the preference of the transposase for the OE termini, as opposed to the Inside End (IE) termini. The higher binding of this mutation, known as the preference of the transposase for the OE terminis about 10-fold higher than seen with wild type transposase. Similar changes at position 54 to valine and position 47 (threonine-to-proline change) also result in increase binding to the OE termini. The reduction in the formation of the inactive multimeric form is achieved by modifying amino acid 372 (leucine) of wildtype TN5 transposase to a proline (class (2) mutation, LP372). The TN5-based transposition system is more broadly applicable and the transposition system is more broadly applicable and the transposition system is more broadly applicable and the transposition system is more broadly applicable on the transposition of the more broadly applicable and the transposition system is more broadly applicable and the transposition and the province the province transposition and the prov

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               comprising of a tumour homing molecule that selectively homes to a mammalian cell type or tissue, linked to an antimicrobial peptide. The homing pro-apoptotic conjugates are selectively internalised by the mammalian cell type or tissue and exhibits high toxicity, especially to anglogenic vasculature. The antimicrobial peptide has low mammalian cell toxicity, when not linked to the tumor homing molecule. The conjugates are useful for the treatment of cancer e.g. Kaposi's sarcoma, breast and prostate cancer or melanoma. The present sequence is a homing peptide antimicrobial peptide to make the homing pro-apoptotic conjugates of the present invention, which can be conjugated to an entimicrobial peptide to make the homing pro-apoptotic conjugates of the present invention.
                                                                    The present invention describes peptides that selectively home to a tissue or organ. The peptides can be used for identifying an organ or tissue, for identifying a tranget molecule expressed by an organ or tissue or for treating an organ or tissue pathology, where the organ or tissue is selected from prostate, lung, skin, retina, pancreas, gut, ovary, adrenal gland, liver, and Iymph node. The peptide bind to the membrane dipeptidase (MDP). AAY48618 to AAY49066 represent sequences which are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Homing pro-apoptotic conjugate comprising a tumor homing molecule that selectively homes to a mammalian cell type or tissue linked to an antimicrobial peptide, useful for the treatment of prostate cancer -

                                                                                                                                                                                                                                                                                                             The patent discloses novel chimeric prostate-homing pro-apoptotic peptide which comprises a prostate-homing peptide linked to an antimicrobial peptide, where the chimeric peptide is selectively internalised by and exhibits high toxicity to prostate tissue and where the antimicrobial peptide has low mammalian cell toxicity when not linked to prostate-homing peptide. The chimeric peptide is used to direct an antimicrobial peptide in vivo to a prostate cancer, to induce selective toxicity in vivo in a prostate cancer, and to treat a patient with prostate cancer. The present sequence is mouse prostate homing peptide. This sequence is useful in the homing of pro-apoptotic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to homing pro-apoptotic conjugates, comprising of a tumour homing molecule that selectively homes to a mammalian cell type or tissue, linked to an antimicrobial peptide. The homing pro-apoptotic conjugates are selectively internalised by the mammalian cell type or tissue and exhibits high toxicity, especially to anglogenic vasculature. The antimicrobial peptide has low mammalian cell toxicity when not linked to the tumor homing molecule. In addition, the antimicrobial peptide has an amphipathic alpha-helical structure. The conjugates are useful for the treatment of cancer e.g. Kaposi's sarcoma, breast and prostate cancer or melanoma. The present sequence is one such prostate homing pro-apoptotic conjugate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Homing pro-apoptotic conjugate comprising a tumor homing molecule that selectively homes to a mammalian cell type or tissue linked to an antimicrobial peptide, useful for the treatment of prostate cancer -

Chimeric prostate-homing pro-apoptotic peptide; prostate-homing peptide; antimicrobial peptide; prostate cancer; breast tumour homing molecule;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The patent discloses novel chimeric prostate-homing pro-apoptotic peptide which comprises a prostate-homing peptide linked to an antimicrobial peptide, where the chimeric peptide is selectively internalised by and exhibits high toxicity to prostate tissue and where the antimicrobial peptide has low mammalian cell toxicity when not linked to prostate-homing peptide. The chimeric peptide is used to direct an antimicrobial peptide in vivo to a prostate cancer, to induce selective toxicity in vivo in a prostate cancer, and to treat a patient with prostate cancer. The present sequence is a chimeric prostate-homing pro-apoptotic peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel chimeric prostate-homing pro-apoptotic peptide, used to treat prostate cancer, comprises a prostate-homing peptide linked to an antimicrobial peptide -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               99US-0142920
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               08-JUL-1999;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     01-JUL-1999
                                                                                                                                                                                                                                                                                                                                                                                                The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucled acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.
                                                                                                                                                                                                                                                                                              Novel polynucleotides derived from Coryneform bacteria, for identifying mutation point of a gene, measuring expression of a gene, analysing expression profile or pattern of a gene and identifying homologous gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                          sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention.
                                                                                                                                                                                                                                             Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the
                                                                 mutation point of a gene, measuring expression of a gene, analysing expression profile or pattern of a gene and identifying homologous gene

AAX36754-Y37949 are encoded by open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). The polypeptides can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye plaseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genttal diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, and venerallymphogranulomatosis. The polypeptides of the invention may be of use in treating these diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    immunomodulatory; cytostatic; neuroprotective; vulnerary; nootropic; anticonvulsant; antiarthritic; cerebroprotective; vulnerary; nootropic; antibacterial; antiallergic; dermatological; haemostatic; antiasthmatic; thrombolytic; immunogen; antibody; gene therapy; neurological disorder; Parkinson's disease; inflammatory disorder; cancer; asthma; osteoporosis; tissue regeneration; immune disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to polynucleotides encoding novel human proteins or their active domains. The polypeptides, polynucleotides and antibodies raised against the polypeptides are used in a method of treatment of a mammal and prevention of disorders caused by the aberrant protein expression or activity. The polypeptides can be used as molecular weight markers, food supplements, and in antibody production. The polypeptides are used to identify compounds which bind to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Isolated polypeptides useful for treating anti-inflammatory diseases, nervous system disorders, and for regenerating bone and cartilage -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; novel protein; Antianaemic; osteopathic; antiinflammatory;

ô
polypeptides. Polynucleotides of the invention are used as probes and primers, for sequencing, for chromosome or gene mapping, in the production of recombinant proteins, and in generating anti-sense DNA or RNA and in gene therapy. Polypeptides of the invention can be used to target drugs to a tumour, in assays to determine biological activity, to raise antibodies/elicit an immune response, to determine quantitative protein levels, as tissue markers, and to isolate receptors or ligands. Polypeptides of the invention may also be useful in treating platelet disorders, stem cell disorders, regenerating bours, promoting the proliferation, differentiation and survival of stem cells, as a contraceptive, treating osteoporasis and osteoarthitis, as an Alzhelmer's, Parkinson's and Huntington's diseases, amylotrophic lateral scalers; stroke, immune deficiencies resulting from bacterial, viral or fermine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; open reading frame; ORFX; detection; cytostatic; hepatotropic; vulnerary; antipsoriatic; antiparkinsonian; nootropic; neuroprotective; anticonvulsant; osteopathic; antiarthritic; immunosupressant; cardiant; immunostimulant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressive; antiinflammatory; antidianemic; gene therapy; cancer; proliferative disorder; hypertension; neurodegenerative disorder; osteoarthritis; graft vs host disease; cardiovascular disease; diabetes mellitus; hypothyroidism; SCID; AIDS;

AAC74446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; heaptorcopic; outnearry; antiparkinsonian; nootropic; neuroprotective; osteopathic; anticonvulsant; antiarthritic; immunosuppressant; immunostimilant; cardiant; thrombolytic; coaquiant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressive; antidiabetic; hypotensive; antidianed vith an ORFX-associated disorder. The presence of or predisposition to, or preventing or treating pathological conditions and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritis, collection, hypothyroidism, cholesterol ester storage, systemic lupus erythematosus, severe combined immunodeficiency (SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimmune disorders, asthma, allergies, aplastic caneamia, burns, wounds, bone and cartilage damage, nocturnal haemoglobinuria, antidifammatory disease; to enhance coagulation; to inhibit thrombosis; and as a contraceptive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                     Novel nucleic acids and peptides derived from open reading frame X,

                                                                                                                    The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium, coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the
                                                                                                                                                                                                                                                                                                                                                              ö
                                  Novel polynucleotides derived from Coryneform bacteria, for identifying mutation point of a gene, measuring expression of a gene, analysing expression profile or pattern of a gene and identifying homologous gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Corynebacterium glutamicum; carbon metabolism and energy production; SMP protein; sugar metabolism and oxidative phosphorylation protein; fine chemical production; organic acid; proteinogenic amino acid; monproteinogenic amino acid; purine base; pyrimidine base; nucleoside; nucleotide; lipid; saturated fatty acid; unsaturated fatty acid; diol; carbohydrate; aromatic compound; vitamin; cofactor; polyketide; enzyme; diagnosis; Corynebacterium diphtheriae; evolutionary study.

metabolism and oxidative phosphorylation (SMP) proteins given in metabolism and oxidative phosphorylation (SMP) proteins given in metabolism and energy production. The C. glutamicum SMP gene can be used in vectors (II) for expression in host cells and production or modulation of production of fine chemicals, such as, an organic acid, a proteinogenic or nonproteinogenic amino acid (preferred), a purine or pyrimidine base, a nucleoside, a nucleoside, a lipid, a saturated or unsaturated fatty cofactor, a polyketide, or an enzyme. The presence of (I) or SMP proteins (III) encoded by them are used for diagnosing the presence or activity of corynebacterium diphtheriae in a subject. (I), (II), (II) or host cells containing them are used to map genomes of organisms related to nevolutionary studies, in determining SMP protein regions required for function, in modulating SMP protein activity, in modulating the metabolism of sugars, and in modulating high-energy molecule production in a cell (i.e. ATP, NADPH).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated Corynebacterium glutamicum nucleic acid encoding a sugar metabolism and oxidative phosphorylation protein for production or modulation of production of fine chemicals e.g. amino acids, carbohydrates or enzymes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAF71360 to AAF71750 encode the Corynebacterium glutamicum sugar
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Haberhauer G;

   Isolated retinoid X receptor protein - having amino acid insert in ligand binding domain, useful to identify specific target genes implicated in retinoid responses important in disease states
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel retinoid X receptors RXR delta (AAW18032) and RXR epsilon (AAW18033) exhibit a high degree of amino acid conservation with other vertebrate RXRs but represent unique subtypes defined by an additional 14-amino acid segment in their ligand binding domains. These RXRs do not bind 9-cis retinoic acid (RA) or all-trans RA with high affinity and are not activated by 9-cis RA. They are able to form dimers in a manner equivalent to other RXRs. Their amino acid sequences were deduced from CDNA clones (AAY67196-97) obtd. from adult and post somitogenesis zebrafish cDNA libraries. The RXRs can be used to identify ligands, isolate mammalian counterparts, modify retinoid activity and identify target genes implicated in retinoid responses important in disease states.

AAA79263 to AAA79736 and AAB25100 to AAB25570 represent polynucleotide and protein sequences isolated from eucalyptus (Eucalyptus grandis) or pine (Phnus radiata also known as Wonterey pine). The protein sequences are involved in cell signalling. The polynucleotide and protein sequences can be used to modify the response of plant cells to external signals e.g. environmental changes or pathogens during the growth and development of a plant. They can be used to modify cell proliferation, differentiation, elongation and survival, resistance to disease and nutrient metabolism: Examples of modifications which can be produced are altered fruit ripening and senescence of leaves and flowers e.g. to delay senescence and prolong the life of cut flowers or enhance consecutions can be used to delay senescence in selected cell types or modifications can be used to delay senescence in selected cell types or can providing fruit and vegetables which have a longer shelf life
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     between harvest and consumption, or to decrease branching frequency ir forest tree species giving long stretches of valuable knot-free clear wood which can be used in solid timber furniture and veneers.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 6, Appli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 257-App.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Description

useful for the treatment of cancer e.g. Kaposi's sarcoma, breast and prostate cancer or melanoma. The present sequence is one such antimicrobial peptide, which can be conjugated to a homing peptide to make the homing pro-apoptotic conjugates of the present invention. The present sequence has an amphipathic alpha-helical structure.
                                                                                                                                                                                                                                                                               1 KLAKLAKKLAKLAK

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to homing pro-apoptotic conjugates, comprising of a tumour homing molecule that selectively homes to a mammalian cell type or tissue, linked to an antimicrobial peptide. The homing pro-apoptotic conjugates are selectively internalised by the mammalian cell type or tissue and exhibits high toxicity, especially to angiogenic vasculature. The antimicrobial peptide has low mammalian cell toxicity when not linked to the tumor homing molecule. The conjugates are
                                                                                                                  charged amino acid residues, or five nonpolar amino acid residues and two positively charged amino acid residues. The nonpolar amino acid residues and the positively charged amino acid residues are distributed within the heptad such that when the multimer forms an alpha-helix the nonpolar amino acid residues will lie on one face of the alpha-helix, and the positively charged amino acid residues will lie on the opposite face of the alpha-helix, whereby the multimer is amphipathic.
                                          AAW62920-67 represent minimalist lytic (channel forming) peptides. The peptides have antibacterial properties in concentrations not lethal toward mammalian cells. The peptides are heptads (or heptad multimers) that comprise four nonpolar amino acid residues and three positively.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Homing pro-apoptotic conjugate comprising a tumor homing molecule that selectively homes to a mammalian cell type or tissue linked to an antimicrobial peptide, useful for the treatment of prostate cancer -

Chimeric prostate-homing pro-apoptotic peptide; prostate-homing peptide;
                                                                                                                                                                                                                                                                                                        antimicrobial peptide; prostate cancer; breast tumour homing molecule;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The patent discloses novel chimeric prostate-homing pro-apoptotic peptide which comprises a prostate-homing peptide linked to an antimicrobial peptide, where the chimeric peptide is selectively internalised by and exhibits high toxicity to prostate tissue and where the antimicrobial peptide has low mammalian cell toxicity when not linked to prostate-homing peptide. The chimeric peptide is used to direct an antimicrobial peptide in vivo to a prostate cancer, to induce selective toxicity in vivo in a prostate cancer, and to treat a patient with prostate cancer. The present sequence is a synthetic anti-microbial peptide having an amphipathic-alpha helical structure. This peptide is linked to a prostate-homing peptide to generate a chimeric prostate-homing pro-apoptotic peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel chimeric prostate-homing pro-apoptotic peptide, used to trea prostate cancer, comprises a prostate-homing peptide linked to an antimicrobial peptide -

                                                                                                                                                                                                                                                                                                                                                                 This peptide is an analogue of a known lytic peptide. It comprises an alpha helical conformation of amino acids. It is effective at lysing e.g. gram-positive and -negative bacteria and mammalian_neo-plastic cells, cells infected with intracellular pathogenic micro-organisms such as HIV. It stimulates the proliferation of fibro-blasts and-lymphocytes-and-can-be-used-in-wound-healing:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Lytic peptide; channel forming peptide; antibacterial; amphipathic.

AAW62920-67 represent minimalist lytic (channel forming) peptides. The peptides have antibacterial properties in concentrations not lethal toward mammalian cells. The peptides are heptads (or heptad multimers) that comprise four nonpolar amino acid residues and three positively charged amino acid residues. The nonpolar amino acid residues and three positively two positively charged amino acid residues. The nonpolar amino acid residues and the positively charged amino acid residues and the positively charged amino acid residues and the heptad such that when the multimer forms an alpha-helix the nonpolar amino acid residues will lie on one face of the alpha-helix, and the positively charged amino acid residues will lie on the opposite face of the alpha-helix, whereby the multimer is amphipathic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Lytic peptide; channel forming peptide; antibacterial; amphipathic.
                                                                                                                                                                                                                                                                                                                                                                                                         Selective lysis of bacteria amongst mammalian cells – using 14-mer or 21-mer lytic peptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ó

                                                                                                                AAW62920-67 represent minimalist lytic (channel forming) peptides. The peptides have antibacterial properties in concentrations not lethal toward mammalian cells. The peptides are heptads (or heptad multimers) that comprise four nonpolar amino acid residues and three positively charged amino acid residues. The nonpolar amino acid residues and three positively testiques and the positively charged amino acid residues. The nonpolar amino acid residues and the positively charged amino acid residues and the positively charged amino acid residues and alternative acid residues are distributed within the heptad such that when the multimer forms an alpha-helix the and the positively charged amino acid residues will lie on one face of the alpha-helix, and the positively charged amino acid residues will lie on the opposite face of the alpha -helix, whereby the multimer is amphipathic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The

The homing pro-apoptotic conjugates are selectively internalised by the mammalian cell type or tissue and exhibits high toxicity, especially to angiogenic vasculature. The antimicrobial peptide has low mammalian cell toxicity when not linked to the tumor homing molecule. In addition, the antimicrobial peptide has an amphipathic alpha-helical structure. The conjugates are useful for the treatment of cancer e.g. Kaposi's sarcoma, breast and prostate cancer or melanoma. The present sequence is one such
toward mammalian cells. The peptides are heptads (or heptad multimers) charged amino acid residues and three positively charged amino acid residues. The nonpolar amino acid residues and two positively charged amino acid residues. The nonpolar amino acid residues and the positively charged amino acid residues are distributed within the heptad such that when the multimer forms an alpha-helix the nonpolar amino acid residues will lie on one face of the alpha-helix, and the positively charged amino acid residues will lie on the opposite
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Homing pro-apoptotic conjugate comprising a tumor homing molecule that selectively homes to a mammalian cell type or tissue linked to an antimicrobial peptide, useful for the treatment of prostate cancer -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Cytostatic; homing pro-apoptotic conjugate; tumour; antimicrobial;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to homing pro-apoptotic conjugates, comprising of a tumour homing molecule that selectively homes to a mammalian cell type or tissue, linked to an antimicrobial peptide. The homing pro-apoptotic conjugates are selectively internalised by the mammalian cell type or tissue and exhibits high toxicity, especially to angiogenic vasculature. The antimicrobial peptide has low mammalian cell exoxicity when not linked to the tumor homing molecule. In addition, the antimicrobial peptide has an amphipathic alpha-helical structure. The conjugates are useful for the treatment of cancer e.g. Kaposi's sarroma, breast and prostate cancer or melanoma. The present sequence is one such
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Homing pro-apoptotic conjugate comprising a tumor homing molecule that selectively homes to a mammalian cell type or tissue linked to an antimicrobial peptide, useful for the treatment of prostate cancer - \frac{1}{2}

Chimeric prostate-homing pro-apoptotic peptide; prostate-homing peptide; antimicrobial peptide; prostate cancer; breast tumour homing molecule; cytostatic; HPP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            6.21
/label= Membrane_disrupting_domain
/label= Membrane_disrupting; This region forms an
mphipathic helix and is useful in imparting increased
stability of the conjugate in vivo"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The patent discloses novel chimeric prostate-homing pro-apoptotic peptide which comprises a prostate-homing peptide linked to an antimicrobial peptide, where the chimeric peptide is selectively internalised by and exhibits high toxicity to prostate tissue and where the antimicrobial peptide has low mammalian cell toxicity when not linked to prostate-homing peptide. The chimeric peptide is used to direct an antimicrobial peptide in vivo to a prostate cancer, to induce selective toxicity in vivo in a prostate cancer, and a patient with prostate cancer. The present sequence is chimeric prostate-homing pro-apoptotic peptide, HPP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    peptide which comprises a prostate-homing peptide linked to an antimicrobial peptide, where the chimeric peptide is selectively internalised by and exhibits high toxicity to prostate tissue and where the antimicrobial peptide has low mammalian cell toxicity when not linked to prostate-homing peptide. The chimeric peptide is used to direct an antimicrobial peptide in vivo to a prostate cancer, to induce selective toxicity in vivo in a prostate cancer, and to treat a patient with prostate cancer. The present sequence is a homing pro-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                           The patent discloses novel chimeric prostate-homing pro-apoptotic peptide which comprises a prostate-homing peptide linked to an antimicrobial peptide, where the chimeric peptide is selectively internalised by and exhibits high toxicity to prostate tissue and where the antimicrobial peptide has low mammalian cell toxicity when not linked to prostate-homing peptide. The chimeric peptide is used to direct an antimicrobial peptide in vivo to a prostate cancer, to induce selective toxicity in vivo in a prostate cancer, and to treat a patient with prostate cancer. The present sequence is a homing proapptotic peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                   This peptide is an analogue of a known lytic peptide. It comprises an alpha helical conformation of amino acids. It is effective at lysing e.g. gram-positive and -negative bacteria and mammanian neo-plastic cells, cells infected with intracellular pathogenic micro-organisms such as HIV. It stimulates the proliferation of fibro-blasts and lymphocytes and can be used in wound healing.

The present invention relates to homing pro-apoptotic conjugates, comprising of a tumour homing molecule that selectively homes to a mammalian cell type or tissue, linked to an antimicrobial peptide. The homing pro-apoptotic conjugates are selectively internalised by the mammalian cell type or tissue and exhibits high toxicity, especially to angiogenic vasculature. The antimicrobial peptide has low mammalian cell toxicity when not linked to the tumor homing molecule. In addition, the antimicrobial peptide has an amphipathic alpha-helical structure. The antimicrobial pestide has an emphipathic alpha-helical structure. The conjugates are useful for the tractment of cancer e.g. Kaposi's sarcoma, breast and prostate cancer or melanoma. The present sequence is one such prostate homing pro-apoptotic conjugate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Chimeric prostate-homing pro-apoptotic peptide; prostate-homing peptide; antimicrobial peptide; prostate cancer; breast tumour homing molecule;
                                                                                                                                                                                                                                                                                                                                                         Homing pro-apoptotic conjugate comprising a tumor homing molecule that selectively homes to a mammalian cell type or tissue linked to an antimicrobial peptide, useful for the treatment of prostate cancer -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The patent discloses novel chimeric prostate-homing pro-apoptotic peptide which comprises a prostate-homing peptide linked to an antimicrobial peptide, where the chimeric peptide is selectively internalised by and exhibits high toxicity to prostate tissue and where the antimicrobial peptide has low mammalian cell toxicity when not linked to prostate-homing peptide. The chimeric peptide is used to direct an antimicrobial peptide in vivo to a prostate cancer, to induce selective toxicity in vivo in a prostate cancer, and to treat a patient with prostate cancer. The present sequence is a chimeric prostate-homing pro-apoptotic peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel chimeric prostate-homing pro-apoptotic peptide, used to treat prostate cancer, comprises a prostate-homing peptide linked to an antimicrobial peptide -

Sequence 21, Application US/09042107

Patent No. 6232287

GENERAL INFORMATION:

GENERAL INFORMATION:

APPLICANT: ROSLAHLI, Erkki
APPLICANT: Pasqualini, Renata
TITLE OF INVENTION: Molecules that Home to Various Selected Organs or
TITLE OF INVENTION: Tissues
FILE REFERENCE: P-LJ 2892

CURRENT APPLICATION NUMBER: US/09/042,107

CURRENT FILING DATE: 1998-03-13

NUMBER OF SEQ ID NOS: 436

SEQ ID NO 21
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              postale down pephase
                                                                                                                                                                                                                                                                                                                                                                        Sequence Sequence 4

                                                                                                          The present invention relates to homing pro-apoptotic conjugates, comprising of a tumour homing molecule that selectively homes to a mammalian cell type or tissue, linked to an antimicrobial peptide. The homing pro-apoptotic conjugates are selectively internalised by the mammalian cell type or tissue and exhibits high toxicity, especially to anglogenic vasculature. The antimicrobial peptide has low mammalian cell toxicity when not linked to the tumor homing molecule. In addition, the antimicrobial peptide has an amphipathic alpha-helical structure. The conjugates are useful for the treatment of cancer e.g. Kaposi's sarcoma, breast and prostate cancer or melanoma. The present sequence is one such
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Chimeric prostate-homing pro-apoptotic peptide; prostate-homing peptide; antimicrobial peptide; prostate cancer; breast tumour homing molecule;

The present invention relates to homing pro-apoptotic conjugates, comprising of a tumour homing molecule that selectively homes to a mammalian cell type or tissue, linked to an antimicrobial peptide. The homing pro-apoptotic conjugates are selectively internalised by the mammalian cell type or tissue and exhibits high toxicity, especially to anglogenic vasculature. The antimicrobial peptide has low mammalian cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Homing pro-apoptotic conjugate comprising a tumor homing molecule that selectively homes to a mammalian cell type or tissue linked to an antimicrobial peptide, useful for the treatment of prostate cancer -
                                          The patent discloses novel chimeric prostate-homing pro-apoptotic peptide which comprises a prostate-homing peptide linked to an antimicrobial peptide, where the chimeric peptide is selectively internalised by and exhibits high toxicity to prostate tissue and where the antimicrobial peptide has low mammalian cell toxicity when not linked to prostate-homing peptide. The chimeric peptide is used to direct an antimicrobial peptide in vivo to a prostate cancer, to induce selective toxicity in vivo to a prostate cancer, to a patient with prostate cancer. The present sequence is a chimeric prostate-homing pro-apoptotic peptide.
                                                                                                                                                                                                                                                                                                                 Gaps

ö
toxicity when not linked to the tumor homing molecule. In addition, the antimicrobial peptide has an amphipathic alpha-helical structure. The conjugates are useful for the treatment of cancer e.g. Kaposi's sarcoma, breast and prostate cancer or melanoma. The present sequence is one such homing pro-apoptotic conjugate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Chimeric prostate-homing pro-apoptotic peptide; prostate-homing peptide; antimicrobial_peptide; prostate cancer; breast tumour homing molecule;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           8..21

The homing pro-apoptotic conjugates are selectively internalised by the mammalian cell type or tissue and exhibits high toxicity, especially to angiogenic vasculature. The antimicrobial peptide has low mammalian cell toxicity when not linked to the tumor homing molecule. In addition, the antimicrobial peptide has an amphipathic alpha-helical structure. The conjugates are useful for the treatment of cancer e.g. Kaposi's sarcoma, breast and prostate cancer or melanoma. The present sequence is one such homing pro-apoptotic conjugate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Homing pro-apoptotic conjugate comprising a tumor homing molecule that selectively homes to a mammalian cell type or tissue linked to an antimicrobial peptide, useful for the treatment of prostate cancer-
to direct an antimicrobial peptide in vivo to a prostate cancer, to induce selective toxicity in vivo in a prostate cancer, and to treat a patient with prostate cancer. The present sequence is chimeric prostate-homing pro-apoptotic peptide, HPP-1.
                                                                                                                                                         Gaps

The chimeric peptide is used to direct an antimicrobial peptide in vivo to a prostate cancer, to induce selective toxicity in vivo in a prostate cancer, and to treat a patient with prostate cancer. The present sequence is a homing pro-

The chimeric peptide is used to direct an antimicrobial peptide in vivo to a prostate cancer, to induce selective toxicity in vivo in a prostate cancer, and to treat a patient with prostate cancer. The present sequence is a homing proapptotic peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to homing pro-apoptotic conjugates, comprising of a tumour homing molecule that selectively homes to a mammalian cell type or tissue, linked to an antimicrobial peptide. The homing pro-apoptotic conjugates are selectively internalised by the mammalian cell type or tissue and exhibits high toxicity, especially to angiogenic vasculature. The antimicrobial peptide has low mammalian cell toxicity when not linked to the tumor homing molecule. In addition, the antimicrobial peptide has an amphipathic alpha-helical structure. The conjugates are useful for the treatment of cancer e.g. Kaposi's sarcoma, breast and prostate cancer or melanoma. The present sequence is one such

Chimeric prostate-homing pro-apoptotic peptide; prostate-homing peptide; antimicrobial peptide; prostate cancer; breast tumour homing molecule;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The patent discloses novel chimeric prostate-homing pro-apoptotic peptide which comprises a prostate-homing peptide linked to an antimicrobial peptide, where the chimeric peptide is selectively internalised by and exhibits high toxicity to prostate tissue and where the antimicrobial peptide has low mammalian cell toxicity when not linked to prostate-homing peptide. The chimeric peptide is used to direct an antimicrobial peptide in vivo to a prostate cancer, to induce selective toxicity in vivo in a prostate cancer, and to treat a patient with prostate cancer. The present sequence is a homing proappototic peptide. This peptide inhibits retinal neovascularisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel chimeric prostate-homing pro-apoptotic peptide, used to treat prostate cancer, comprises a prostate-homing peptide linked to an antimicrobial peptide -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ő
                                                                                                                                                                                                                                                                    The present invention relates to homing pro-apoptotic conjugates, comprising of a tumour homing molecule that selectively homes to a mammalian cell type or tissue, linked to an antimicrobial peptide. The homing pro-apoptotic conjugates are selectively internalised by the mammalian cell type or tissue and exhibits high toxicity, especially to angiogenic vasculature. The antimicrobial peptide has low mammalian cell toxicity when not linked to the tumor homing molecule. In addition, the antimicrobial peptide has an amphipathic alpha-helical structure. The conjugates are useful for the treatment of cancer e.g. Kaposi's sarcoma, breast and prostate cancer or melanoma. The present sequence is one such homing pro-apoptotic conjugate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Chimeric prostate-homing pro-apoptotic peptide; prostate-homing peptide; antimicrobial peptide; prostate cancer; breast tumour homing molecule; cytostatic.

The patent discloses novel chimeric prostate-homing pro-apoptotic peptide which comprises a prostate-homing peptide linked to an antimicrobial peptide, where the chimeric peptide is selectively internalised by and exhibits high toxicity to prostate tissue and where the antimicrobial peptide has low mammalian cell toxicity when not linked to prostate-homing peptide. The chimeric peptide is used to direct an antimicrobial peptide in vivo to a prostate cancer, to induce selective toxicity in vivo in a prostate cancer, and a patient with prostate cancer. The present sequence is a homing pro-apoptotic peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                peptides have antibacterial properties in concentrations for lethal toward mammalian cells. The peptides are heptads (or heptad multimers) that comprise four nonpolar amino acid residues and three positively charged amino acid residues. The nonpolar amino acid residues are nonpolar manno acid residues and two positively charged amino acid residues. The nonpolar amino acid residues are distributed within the heptad such that when the multimer forms an alpha-helix the nonpolar amino acid residues will lie on one face of the alpha-helix, and the positively charged amino acid residues will lie on the opposite face of the alpha-helix, whereby the multimer is amphipathic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAW62920-67 represent minimalist lytic (channel forming) peptides. The peptides have antibacterial properties in concentrations not lethal toward mammalian cells. The peptides are heptads (or heptad multimers) that comprise four nonpolar amino acid residues and three positively
                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The peptides have antibacterial properties in concentrations not lethal toward mammalian cells. The peptides are heptads (or heptad multimers) that comprise four nonpolar amino acid residues and three positively charged amino acid residues. The nonpolar amino acid residues and three positively charged amino acid residues and the nonpolar amino acid residues and within the heptad such that when the multimer forms an alpha-helix the nonpolar amino acid residues will lie on one face of the alpha-helix, and the positively charged amino acid residues will lie on the opposite face of the alpha-helix, whereby the multimer is amphipathic.
charged amino acid residues, or five nonpolar amino acid residues and two positively charged amino acid residues. The nonpolar amino acid residues and the positively charged amino acid residues are distributed within the heptad such that when the multimer forms an alpha-helix the nonpolar amino acid residues will lite on one face of the alpha-helix, and the positively charged amino acid residues will lite on the opposite face of the alpha-helix, and the positively charged amino acid residues will lite on the opposite face of the alpha-helix, whereby the multimer is amphipathic.
                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Lytic peptide; channel forming peptide; antibacterial; amphipathic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Selective lysis of bacteria amongst mammalian cells – using 14-mer or 21-mer lytic peptides

The peptides have antibacterial properties in concentrations not lethal toward mammalian cells. The peptides are heptads (or heptad multimers) that comprise four nonpolar amino acid residues and three positively charged amino acid residues. The nonpolar amino acid residues and three positively two positively charged amino acid residues. The nonpolar amino acid residues and the heptad such that when the multimer forms an alpha-helix the within the heptad such that when the multimer forms an alpha-helix the and the positively charged amino acid residues will lie on one face of the alpha-helix, and the positively charged amino acid residues will lie on the opposite face of the alpha-helix, whereby the multimer is amphipathic.
